Make your own map with MapLibre

Make your own base map with MapLibre and Planetiler [workshop] ★

Saturday, November 15, 1:30 PM, Node, [Cartography & Outputs](#)

In this workshop we will generate base map tiles from OSM data using Planetiler, set up Martin tile server, set up nginx to serve our sample web site that will use MapLibre GL JS to show the map.

You do not need to install any software prior to the workshop.

Requirements:

- A laptop.
- A GitHub account. This is needed because we will use GitHub Codespaces to set up the working environment.
- Some experience with the terminal is helpful. Or bring a friend that does.

Bart Louwers

Bart is the maintainer of MapLibre Native, an open source community driven map rendering toolkit used by many such as OSM editors, ride sharing apps, hiking navigation apps and many more. In his free time he likes to kayak, play board games and map.

Workshop

MLT In-Memory Format

- Is inspired by the in-memory analytics formats such as Apache Arrow as well as the 3D graphics format glTF and is tailored for the map visualization use case to be efficiently processed and rendered at runtime
- Allow random (constant time) access to all data, so it can also be parallel processed on the GPU (e.g. on WebGPU compute shader)
- The data are stored in Vectors that are arrays of data of the same type
- The vectorized query execution model will be used to process the Vectors in batches instead of single records
- Vectors can be stored in compressed form for faster decoding and efficient processing → flat, const, sequence, dictionary and fast dictionary Vectors**

2024: MapLibre Tiles: A Next Generation Vector Tiles Format specially designed for OSM data

183 weergaven • 5 maanden geleden

State of the Map

MapLibre Tiles (MLT) is a new vector tiles format which offers a significant tile size reduction and accelerated decoding ...

MapLibre Tiles

- The MLT format is mainly inspired by the Mapbox VectorTile specification but has been redesigned from the ground to address key challenges such as a continuously growing amount of data and new more complex geospatial source formats
- As with MVT, the geometries are based on the Simple Feature Access (SFA) model of the OGC and are defined in a screen coordinate system
- The main design goal of MLT is to support fast rendering of large (planet-scale) 2D and 2.5 basemaps
- To combine a good compression ratio with fast decoding and processing, the MLT format is split into an in-memory and a storage format
- The format is designed to enable fast transcoding of the storage into the in-memory format as well as to be efficiently processed and rendered at runtime

FOSS4GE 2024 | MapLibre Tiles: Introducing The Next Generation Vector Tiles Format
