Planning the day hikes using open data

Zsolt Raven

Planning day hikes using open data

**az irreleváns kérdés, amire megpróbálnám keresni a választ,
ha végtelenül sok fölösleges időm volna**

hol található Magyarországon a hely, ami a legtávolabb van egy Kossuth utcától?

Posted 6 years ago

961 notes • View comments

the irrelevant question I would try to find the answer
to

if I had an infinite amount of unnecessary time

where is the place in Hungary that is the farthest away
from a Kossuth street?

Context time!

Lajos Kossuth

- Lived 1802-1894
- Hungarian statesman
- “Father of Hungarian Democracy”
- Almost all towns and villages will have a “Kossuth street”
- It is more likely to have than a “High Street” (Fő út)

Kossuth County

Terrible Maps

January 9 · 🌐

Iowa has 99 counties. It could have an even 100 if not for this monstrosity

the irrelevant question I would try to find the answer to
if I had an infinite amount of unnecessary time

where is the place in Hungary that is the farthest away
from a Kossuth street?

Van-e valakinek ötlete olyan kék túra szakaszra, ami 15-20 km közötti és megközelíthető úgy, hogy A ponton hagyom a kocsit, eltömegközlekedek B pontra és visszasétálok A pontba.

Does anyone have any ideas for a section of the National Blue Trail that is between 15-20 km long and can be accessed by

- * leaving the car at point A
- * taking public transport to point B
- * and walking back to point A to the car

Context time!

National Blue Trail

- First long-distance walking route in Europe first way-marked in 1938
- Initially 910 km, but later extended to all around Hungary to 2595 km
- It's name comes from the blue marks along the trail showing the way
- Official rules one how to complete the full trail with 304 stamps you need to collect in the official guidebooks along the route
- There is no time limit and you can complete the whole route in small sections

What do we need?

Data

- The official route, including the list of sections
 - Publicly available from the National Blue Trail Website
<https://www.kektura.hu>
- Public transport data
 - ~~OpenStreetMap~~
 - GTFS data (General Transit Feed Specification)
 - Long-distance buses (Volánbusz)
 - Budapest (BKK)
 - ~~Trains (MÁV)~~
- Walking routes between bus stops and the trail itself
 - OpenStreetMap

What do we need?

Tools

- QGis
 - Manual editing of the input data
- Postgres, with PostGIS and pg_routing
 - Bulk route calculations
- OpenTripPlanner
 - Local system to obtain public transport connections in bulk

How to do this?

- Full details on the project website: <https://github.com/sztupy/kekkor-kereso>

Mapping

For the routing to work we need to route from vertices. In order to do that we need to find the closest vertex to each of the bus stops and stamping places:

```
alter table bus_stops add column closest_vertex int;

update bus_stops set closest_vertex = (
  select id from ways_vertices_pgr
  where ST_DWITHIN(bus_stops.geom, ways_vertices_pgr.the_geom, 0.01)
  order by ST_DISTANCE(bus_stops.geom, ways_vertices_pgr.the_geom) ASC LIMIT 1
) where closest_vertex is null;

alter table stamp_points add column closest_vertex int;

update stamp_points set closest_vertex = (
  select id from ways_vertices_pgr
  where ST_DWITHIN(stamp_points.geom, ways_vertices_pgr.the_geom, 0.01)
  order by ST_DISTANCE(stamp_points.geom, ways_vertices_pgr.the_geom) ASC LIMIT 1
) where closest_vertex is null;
```

How to do this?

- Full details on the project website: <https://github.com/sztupy/kekkor-kereso>
- First is lots of manual and semi-manual cleanup of the data
 - Mostly making sure the three sources of data align properly
 - National Blue Trail
 - OpenStreetMap
 - Public transport data from GTFS

How to do this?

- Full details on the project website: <https://github.com/sztupy/kekkor-kereso>
- Next is running a custom script that would go through each viable section(s) of the trail
 - And first find the nearest bus stops
 - Use OSM data to calculate the walking route between the section's end points and the bus stops
 - And then using OpenTripPlanner to calculate if there's a viable bus route between the two bus stops
- This is done in bulk, the whole calculation took around 10 hours to finish

How to do this?

- Full details on the project website: <https://github.com/sztupy/kekkor-kereso>
- Presentation. We need to have a nice website to show the results, and allow people to play around with the data
- <https://sztupy.hu/kekkor-kereso>
- Hungarian-only right now

Example

Húvösvölgy - Rozália brick factory

Starting point : Solymár, brick factory
access road @ 05:27 / 07:25 / 08:26 / 09:26 /
10:26 / 11:26 / 12:26

Public transport: 28 minutes (+ 1 transfer)

Walking : 14.945km

Of which blue circle : 14.067km

Selected section

Blue Circle : 14.067km

Start : Children's Railway - On the
platform, on the outer wall of the building.
(OKTPH_68_1)

Finish : Rozália Brick Factory - On the
electricity pole next to the main gate of the
brick factory. (OKTPH_71)

Sections

Starting point

Solymár, brick factory access road

Public transport

Total : 28 minutes (+ 1 transfer)

Public transport : 9 minutes

Flight : 830

Start : Solymár, brick factory access road

Destination : Solymár, Pilisvörösvári út

Departure : 05:27, 07:25, 08:26, 09:26,
10:26, 11:26, 12:26

Future?

- Really want to do something similar to Scotland
- However
 - No good free database of walking routes
 - WalkHighlands is the biggest source, but their licensing is opaque
 - They're quite unfriendly towards people using their data
 - No good database for public transport
 - Bus Open Data Service is only available for England
 - While a lot of Scottish bus operators are nevertheless included, especially more local/rural ones are missing

State of the Map Europe, Dundee 2025

OpenGeofiction?

- *“OpenGeofiction (OGF) is a collaborative platform for creating fictional maps*
- *We are a community of mappers who use our knowledge, experience, and imagination to craft a fictional world set in the modern day and with an emphasis on realism. Our world does not include fantastical or science-fiction elements, like orcs, elves, or aliens. Rather, it features power plants, motorways, and housing projects alongside picturesque old towns, beautiful national parks, and lonely beaches.*
- *... Because our site is based on the OpenStreetMap software platform, all map editors and other tools compatible with OpenStreetMap can be used to build this fictional world.”*

Problem

- Lore, lists and churn...
- Loads of effort spent tidying wiki site, don't want to fill it (again) with loads of manual data
- Supporting data should be built automatically from the map dataset

- Overpass > Perl script > JSON files > MediaWiki
 - (ExternalData and MultiMaps extensions)
 - Run hourly

```

SeenTerritories{$ogfid} = $id;

# is the territory canonical?
if( exists $canonicalTerritories{$ogfid} and $ogfid ne $record->{tags}->{'name'} )
{
    $currentTerritory{'ogf:id'}           = $ogfid;
    $currentTerritory{'is_in:country'}    = $record->{'tags'}{'int_name'} || $record->{'tags'}{'name'} || $ogfid;
    $currentTerritory{'is_in:country:wiki'} = $record->{'tags'}{'ogf:wiki'} || $record->{'tags'}{'ogfwiki'} || $ogfid;
    $currentTerritory{'is_in:continent'}   = parseContinent $record->{'tags'}{'is_in:continent'}, $ogfid;

    print "> parsing airports in $canonicalTerritories{$ogfid} $ogfid: $record->{tags}->{name}\n";
}
elsif( exists $canonicalTerritories{$ogfid} and $ogfid eq $record->{tags}->{'name'} )
{
    print "> SKIPPING airports in $ogfid: territory name not set\n";
}
else
{
    print "> SKIPPING airports and airlines in non-canonical $ogfid: $record->{tags}->{name}\n";
}
}

# is this an airport?
if( exists $record->{tags}->{aeroway} and $record->{tags}->{aeroway} eq 'aerodrome' )
{
    # can we add an airport entry to flush out?
    $airportSentry; $sentry = {};

    # valid territory?
    next if( !exists $currentTerritory{'ogf:id'} );

    $sentry->{'ref'}           = parseAirportRef $record->{tags}->{'ref'}, $record->{tags}->{'lat'};
    $sentry->{'ogf:id'}        = $currentTerritory{'ogf:id'};
    $sentry->{'is_in:continent'} = $currentTerritory{'is_in:continent'};
    $sentry->{'is_in:country'}  = $currentTerritory{'is_in:country'};
    $sentry->{'is_in:country:wiki'} = $currentTerritory{'is_in:country:wiki'};
    $sentry->{'id'}            = $id;
    $sentry->{'name'}          = $record->{tags}{int_name} || $record->{tags}{name};
}

```

Make your own map with MapLibre

Make your own base map with MapLibre and Planetiler [workshop] ★

Saturday, November 15, 1:30 PM, Node, [Cartography & Outputs](#)

In this workshop we will generate base map tiles from OSM data using Planetiler, set up Martin tile server, set up nginx to serve our sample web site that will use MapLibre GL JS to show the map.

You do not need to install any software prior to the workshop.

Requirements:

- A laptop.
- A GitHub account. This is needed because we will use GitHub Codespaces to set up the working environment.
- Some experience with the terminal is helpful. Or bring a friend that does.

Bart Louwers

Bart is the maintainer of MapLibre Native, an open source community driven map rendering toolkit used by many such as OSM editors, ride sharing apps, hiking navigation apps and many more. In his free time he likes to kayak, play board games and map.

MLT In-Memory Format

- Is inspired by the in-memory analytics formats such as Apache Arrow as well as the 3D graphics format glTF and is tailored for the map visualization use case to be efficiently processed and rendered at runtime
- Allow random (constant time) access to all data, so it can also be parallel processed on the GPU (e.g. on WebGPU compute shader)
- The data are stored in Vectors that are arrays of data of the same type
- The vectorized query execution model will be used to process the Vectors in batches instead of single records
- Vectors can be stored in compressed form for faster decoding and efficient processing → flat, const, sequence, dictionary and fast dictionary Vectors**

2024: MapLibre Tiles: A Next Generation Vector Tiles Format specially designed for OSM data

183 weergaven • 5 maanden geleden

State of the Map

MapLibre Tiles (MLT) is a new vector tiles format which offers a significant tile size reduction and accelerated decoding ...

tile format

MapLibre Tiles

- The MLT format is mainly inspired by the Mapbox Vector Tile specification but has been redesigned from the ground to address key challenges such as a continuously growing amount of data and new more complex geospatial source formats
- As with MV, the geometries are based on the Simple Feature Access (SFA) model of the OGC and are defined in a screen coordinate system
- The main design goal of MLT is to support fast rendering of large (planet-scale) 2D and 2.5 basemaps
- To combine a good compression ratio with fast decoding and processing, the MLT format is split into an in-memory and a storage format
- The format is designed to enable fast transcoding of the storage into the in-memory format as well as to be efficiently processed and rendered at runtime
